You said:

is onmicrosoft free to have as mail address ?

Copilot said:

Copilot

Short answer: Yes, it is technically free — but it is NOT meant to be used as your real email address.

Here's the full explanation:

✓ Is an onmicrosoft.com email address free?

Yes.

When you create a Microsoft 365 tenant, Microsoft automatically gives you a free default domain like:

yourtenant.onmicrosoft.com

This includes free system-generated email addresses such as:

user@yourtenant.onmicrosoft.com

This default domain is created automatically so you can start using services immediately. This is confirmed by Microsoft's documentation and community answers showing that every new tenant receives an onmicrosoft.com fallback domain at no cost.
microsoft

✓ BUT — you should NOT use onmicrosoft.com as your main email
Multiple sources warn that using onmicrosoft.com as a normal business email address is a bad idea, and Microsoft is actively restricting it.

Problems:

1. Not professional

It looks like a temporary system email, not a company domain.
thatlazyadmin

2. Hurts email deliverability

Because everyone shares the onmicrosoft namespace, spam abuse affects all tenants.
thatlazyadmin

3. Microsoft is throttling these emails

Starting October 2025, Microsoft limits onmicrosoft.com addresses to 100 external emails per day to stop spam.
theregister
+1

This means if you try to use it as a normal email, it may stop working for sending.

4. Microsoft officially says it's only for testing

The onmicrosoft domain is intended only for initial setup or internal testing, not for long-term communication.
windowsreport

✓ **So is it free? Yes.

Is it usable as your main email? No.**

To properly use Microsoft 365 email, you must add your own domain:

yourname@yourcompany.com

Microsoft's guidance explains you can add and verify your domain in the Microsoft 365 admin center, then update your users' email addresses accordingly.
microsoft

✓ If you want, I can guide you through:

✓ How to add your custom domain

✓ How to switch from onmicrosoft.com to your real domain

✓ How to configure DNS (MX, SPF, DKIM) for professional email

Just tell me what you want to set up!

You said:

do you actually know some API testing apps

Copilot said:

Copilot

Yes — I can absolutely recommend popular and reliable API testing apps that developers commonly use. Here's a clean, practical list to help you choose the right tool depending on your needs:

✓ Top API Testing Apps

1 *Postman (Most Popular)*

Very user- friendly

Great for REST, GraphQL, and SOAP

Supports automated tests and collections

Has cloud syncing and collaboration

Excellent for beginners and advanced users

Best overall choice.

2 *Insomnia*

Clean, fast, lightweight

Great for REST and GraphQL

Environment variables & scripting

Preferred by developers who want speed and simplicity

3 *Swagger / OpenAPI (Swagger UI + Swagger Editor + SwaggerHub)*

Ideal if your API uses OpenAPI specs

You can generate, test, and document APIs

API mocking and client SDK generation

4 *Hoppscotch (formerly Postwoman)*

Online, open- source, super fast

No installation required

Supports REST, GraphQL, WebSocket

Great for quick testing in the browser

5 K6 (Performance Testing)

API load & stress testing tool

Scriptable in JavaScript

Integrates with CI/CD

6 JMeter

Open- source load testing tool

Good for performance testing APIs

Heavy but very powerful

7 RapidAPI Client

Browser extension & VS Code plugin

Great if you want API testing directly inside your editor

Good for working with public APIs

8 ReadyAPI (SoapUI Pro)

Best for enterprise-level API testing

Supports REST, SOAP, security testing, automation

Not free, but powerful for big projects

✓ If you want recommendations based on your use case:

Tell me:

✓ Are you testing REST, SOAP, or GraphQL?

✓ Do you prefer simple UI, automation, or performance testing?

✓ Do you want free or enterprise-level tools?

I'll tailor the perfect list for your project.

You said:

what are these:

✓ Are you testing REST, SOAP, or GraphQL?

✓ Do you prefer simple UI, automation, or performance testing?

means

Copilot said:

Copilot

Great question! Let me explain these terms in a simple, friendly way, so you understand exactly what I meant.

✓ 1. "Are you testing REST, SOAP, or GraphQL?" — What does this mean?

These are types of APIs (ways for apps to communicate).
Different API testing tools work better depending on which type you use.

✓ REST API

The most common type

Uses URLs like:

<https://api.company.com/users>

Works with standard HTTP methods like GET, POST, PUT, DELETE

Easy to test in tools like Postman, Insomnia, Hoppscotch

Example: When you call a weather API to get the temperature.

✓ SOAP API

Older, more strict format

Uses XML data (not JSON)

Harder to read, requires specific tools

Tools like SoapUI or ReadyAPI are best

Example: Some banking systems still use SOAP because it requires strict contracts.

✓ GraphQL API

Newer and more flexible

You ask for exactly the data you want

Uses a single endpoint like:

<https://api.company.com/graphql>

Best tested using Insomnia or Apollo Playground

Example: Asking for user info and their posts and their comments in one request.

✓ 2. “Do you prefer simple UI, automation, or performance testing?” — What does this mean?

Different people need different features depending on what they’re doing.

✓ Simple UI (Easy to Use)

You want a tool that is easy to understand, clean, and not too technical.

Best tools:

Insomnia

Hoppscotch

Postman (easy but more features)

Good if:

You are starting API testing

You want a simple interface

You test manually

✓ Automation (for DevOps / CI/CD)

You want a tool that can run tests automatically, for example:

Every time you push to GitHub
As part of a pipeline
For regression testing
Best tools:

Postman (Newman CLI)
K6
ReadyAPI (SoapUI Pro)
Good if:

You work on a team
You need repeatable automated tests
You want to integrate with CI/CD
✓ Performance Testing (Speed & Stress)
You want to test:

How fast your API responds
How it performs under heavy load
How many users it can handle
Best tools:

K6
JMeter
Locust
Good if:

You're testing scalability
You work on backend systems
You want to simulate 1,000+ users
✓ In short:

Question Meaning

REST, SOAP, GraphQL? What type of API are you testing?

Simple UI, automation, or performance? What kind of testing experience you prefer?

✓ If you want, I can recommend the best API testing app for YOU

Just tell me:

What type of API are you testing? (REST / SOAP / GraphQL / Not sure)

What do you want the tool to do?

Simple manual testing

Automation

Performance / load testing

I'll give you the perfect tool!

You said:

REST and SOAP means what

Copilot said:

Copilot

Here's a simple, clear explanation of what REST and SOAP mean in API testing — no technical overload.

✓ What is REST?

REST = Representational State Transfer

Think of REST as the modern, simple, flexible way apps talk to each other over the web.

✓ REST uses:

URLs like:

<https://api.example.com/users>

Regular HTTP actions:

GET → fetch data

POST → create data

PUT → update data

DELETE → remove data

JSON format (most common):

JSON

```
{ "name": "Mohamed", "age": 23 }
```

✓ Why REST is popular:

Easy to learn

Faster

Used by 90% of modern APIs

Works well with mobile apps, web apps, and cloud services

✓ Example:

Your weather app calls a REST API to get today's temperature.

✓ What is SOAP?

SOAP = Simple Object Access Protocol

SOAP is the older, very strict, more complex method of building APIs.

✓ SOAP uses:

XML format only (looks like this):

XML

```
<User>
  <Name>Mohamed</Name>
  <Age>23</Age>
</User>
```

A special protocol with rules for:

Security

Error handling

Messaging structure

✓ Why SOAP is still used:

Extremely secure

Very reliable

Used by banks, government services, and big enterprise systems

✓ Example:

A bank system processing money transfers often uses SOAP.

✓ REST vs SOAP (Easy Comparison)

Feature	REST	SOAP
Data format	JSON, XML, others	XML only
Speed	Faster	Slower
Complexity	Simple	Complex, strict
Best for	Mobile, web, modern apps	Banking, finance, enterprise
Flexibility	Very flexible	Very strict
Popularity today	★★★★★	★★

✓ In simple words:

REST = fast, modern, lightweight

SOAP = strict, heavy, but very secure and reliable

If you want, I can also explain GraphQL or which API testing tool fits REST or SOAP.
